

CSCE 242: Project Topic

Name of Website:

App Prospector

Description of Topic:

I currently have a sales internship with a custom software company in Columbia. One of the challenges I face is identifying companies that would benefit from improved software solutions. With this tool, I want to be able to find low-rated mobile apps and then save them into a database, giving me a clearer view of potential leads. Selling software isn't like selling any other product; you have to spot clues that indicate a company has a need, such as a poor app rating or bad user feedback. This website will help me organize, filter, and track apps that could be good targets for prospecting. By the end, this project will not only fulfill the requirements of the project but also serve as a practical tool for my professional growth.

Page Names:

- **Home** – Overview of the project and explanation of its purpose.
- **Database** – Full searchable/browsable list of apps stored in the system.
- **Add/Edit App** – Form page for entering new apps into the database or editing existing ones.
- **Prospect List** – A customized list of saved “low-rated” apps that I want to target, with notes included.
- **About/Contact** – Information about the project, myself, and ways to reach me.

Data I'd Store:

The data stored in the database will include the following:

- App name
- Industry/category
- Rating (1–5 stars)
- Link to the app store
- Notes/prospecting comments

Users will be able to add new apps through a form, view the full database, and edit or delete entries as needed. The database will allow filtering and sorting, such as by rating or industry, so that low-rated apps can be quickly identified. This persistent data storage will allow me to manipulate and organize information for prospecting in a meaningful way.
